

High working and breaking loads for a long service life

# Blocks „made in Germany“

Benefit from decades of experience in planning, design and manufacturing

Hello ,

Blocks and pulleys are used in various fields. They are a must for sailing ships, but are also suitable for security sectors, home, garden and many other industrial uses. When choosing the right block, the type of bearing plays an essential role. While the ball bearing is particularly suitable for light fiern, the choice falls better on the sliding bearing for standing loads. If everything shall run smoothly even at extremely high loads, the needle bearing is suitable.

### The various bearings compared

#### heavy-duty sliding bearing

- breaking load: min. 600kg
- safety working load: min. 300kg
- especially suitable for standing loads

#### easily running plastic ball bearing

- breaking load: min. 600kg
- safety working load: min. 150kg
- especially suitable for slightly veering

#### low-friction needle bearing - stainless steel

- breaking load: min. 600kg
- safety working load: min. 300kg
- easily running even with high loads

### Perfect matching of all components

The blocks from Sprenger impress with a material combination of stainless steel and fiberglass-reinforced, UV-resistant plastic. The edge-free, curved side part ensures ideal rope guidance. The form-stable, continuous stainless steel pocket provides safety and stability.

We offer blocks in various sizes and variants. The matching slides and genoa rails are also available directly from stock!

### \*Product recommendations:

**Sprenger super miniblock with slide bearing 8146082**

A2/ Plastic  
Rope 4 - 10 mm

## Mixed reality for your perfectly designed point of sale

### View your new sales wall before it is installed

You want to equip your shop area with blistered stainless steel products, but you don't know whether a sales wall fits into your concept and where it will have the best effect? We will show you! Take a look at our products in your store from all perspectives before you buy it. Mixed reality makes it possible: The products are displayed on the spot via glasses and placed where you want them. In addition, the view from the glasses is displayed on a tablet. In this way, different concepts can be stored and compared with each other later. The product design is adjusted in advance so that the virtual representation reflects the real end result.

### NEW:

By the way, we have a new display stand in our portfolio.

It measures 30 cm wide on each of the four sides and has a height of 180 cm with Ø 50 cm base diameter. This allows the placement of up to 200 items.

## Prevent galvanic corrosion

"Galvanic corrosion" or "contact corrosion" describes a chemical process that occurs when two dissimilar metals are bonded and have contact with an electrolyte such as water or moisture. Ions flow from the less noble material, which acts as the anode, toward the more noble material, which acts as the cathode. As a result, the lower-grade metal dissolves over time and corrosion occurs.

With our TIKAL TEF-GEL you create a separating layer that stops the chemical reaction. The waterproof paste is based on polytetrafluoroethylene (PTFE), which is highly unreactive. This resistance also makes TIKAL TEF-GEL suitable as a seawater-resistant lubricant and can be used as a sealant to prevent water penetration.

### Examples of application areas:

- Boat industry
- automotive industry
- Aerospace industry
- offshore
- Outdoor constructions of any kind

**TIKAL TEF-GEL is not harmful to health and has no danger labels.**
